

Homework Assignment #8 - Due Mon. 4/08/13

- 1) You decide to attend a rock concert without earplugs. You sit where the sound power level is 109 dB. How long until you have permanent hearing loss?

$$109dB \rightarrow 1.875\text{min},$$

per "Decibel Exposure Time Guidelines"

- 2) At the rock concert in (1), you decide to sit in the back where the sound power level is only 103 dB. How long until you have permanent hearing loss?

$$103dB \rightarrow 7.5\text{min},$$

per "Decibel Exposure Time Guidelines"

- 3) A doubled clamped spring style accelerometer consists of a Si proof mass ($500\mu\text{m}$ thick and 1mm by 1mm) and a suspension system (2 rectangular beams, one on one side and one on the other side of the PM, $100\mu\text{m}$ long, $10\mu\text{m}$ wide and $5\mu\text{m}$ thick). For a Young's modulus of 190GPa and a density of 2.3g/cm^3 , what is the sensitivity of the accelerometer?

$$S = m/K_s: m = \rho * v: K_s = \frac{N_{LEG}}{N_{ZIG}} \frac{E * w * t^3}{L^3}$$

$$m = 2.3\text{g/cm}^3 \times \frac{(100^3)\text{cm}^3 \times \text{kg}}{1000\text{g} \times \text{m}^3} \times (500\mu\text{m})(1\text{mm})^2$$

$$m = 1.15 \times 10^{-6}\text{kg}$$

$$K_s = \frac{2}{1} \times \frac{190 \times 10^9 (10 \times 10^{-6})(5 \times 10^{-6})^3}{(100 \times 10^{-6})^3}$$

$$K_s = 475\text{N/m}$$

$$S = m/K_s = \frac{1.15 \times 10^{-6}}{475\text{N/m}}$$

$$S = 2.42 \times 10^{-9}\text{s}^2$$

- 4) For an accelerometer with a natural frequency of 1000Hz , what is the proof mass / frame relative displacement for a 10G acceleration ($1\text{G} = 9.8\text{m/s}^2$)?

$$d = a \times S: \omega_n = 2\pi 1000: a = 10 \times 9.8\text{m/s}^2$$

$$S = \frac{1}{\omega_n^2} = \frac{1}{(2\pi 1000)^2} = 25.33 \times 10^{-9}\text{s}^2$$

$$d = a \times S = 10 \times 9.8 \times 25.33 \times 10^{-9}$$

$$d = 2.48\mu\text{m}$$

- 5) What is the natural frequency (in Hz) for an accelerometer where a 10G acceleration ($1\text{G} = 9.8\text{m/s}^2$) results in a proof mass / frame relative displacement of $10\mu\text{m}$?

$$d = 10\mu\text{m}: a = 10 \times 9.8\text{m/s}^2$$

$$S = d/a = \frac{10\mu\text{m}}{10 \times 9.8} = 102.04 \times 10^{-9}\text{s}^2$$

$$S = (\omega_n^2)^{-1} \rightarrow \omega_n = \sqrt{1/S}$$

$$\omega_n = \sqrt{1/(102.04 \times 10^{-9}\text{s}^2)} = 3.13\text{krad/s}$$

$$f_n = \omega_n/(2\pi) = 498\text{Hz}$$

- 6) For $a(t) = 2u(t)$, what is $V_{out}(t)$? (See figure below)

$$E(s) = A(s) - V_{out}(s): V_{out}(s) = E(s)(1/s)$$

$$V_{out} = (A(s) - V_{out}(s))(1/s) \rightarrow V_{out}(s) = \frac{A(s)}{s+1}$$

$$A(s) = 2 * (1/s) \rightarrow V_{out}(s) = \frac{2}{s^2+s}$$

$$V_{out}(s) = \frac{2}{s} - \frac{2}{s+1}$$

$$V_{out}(t) = \mathcal{L}^{-1}\left[\frac{2}{s} - \frac{2}{s+1}\right]$$

$$V_{out}(t) = 2(1) - 2(e^{-t}) = 2(1 - e^{-t})$$
